

Vredo

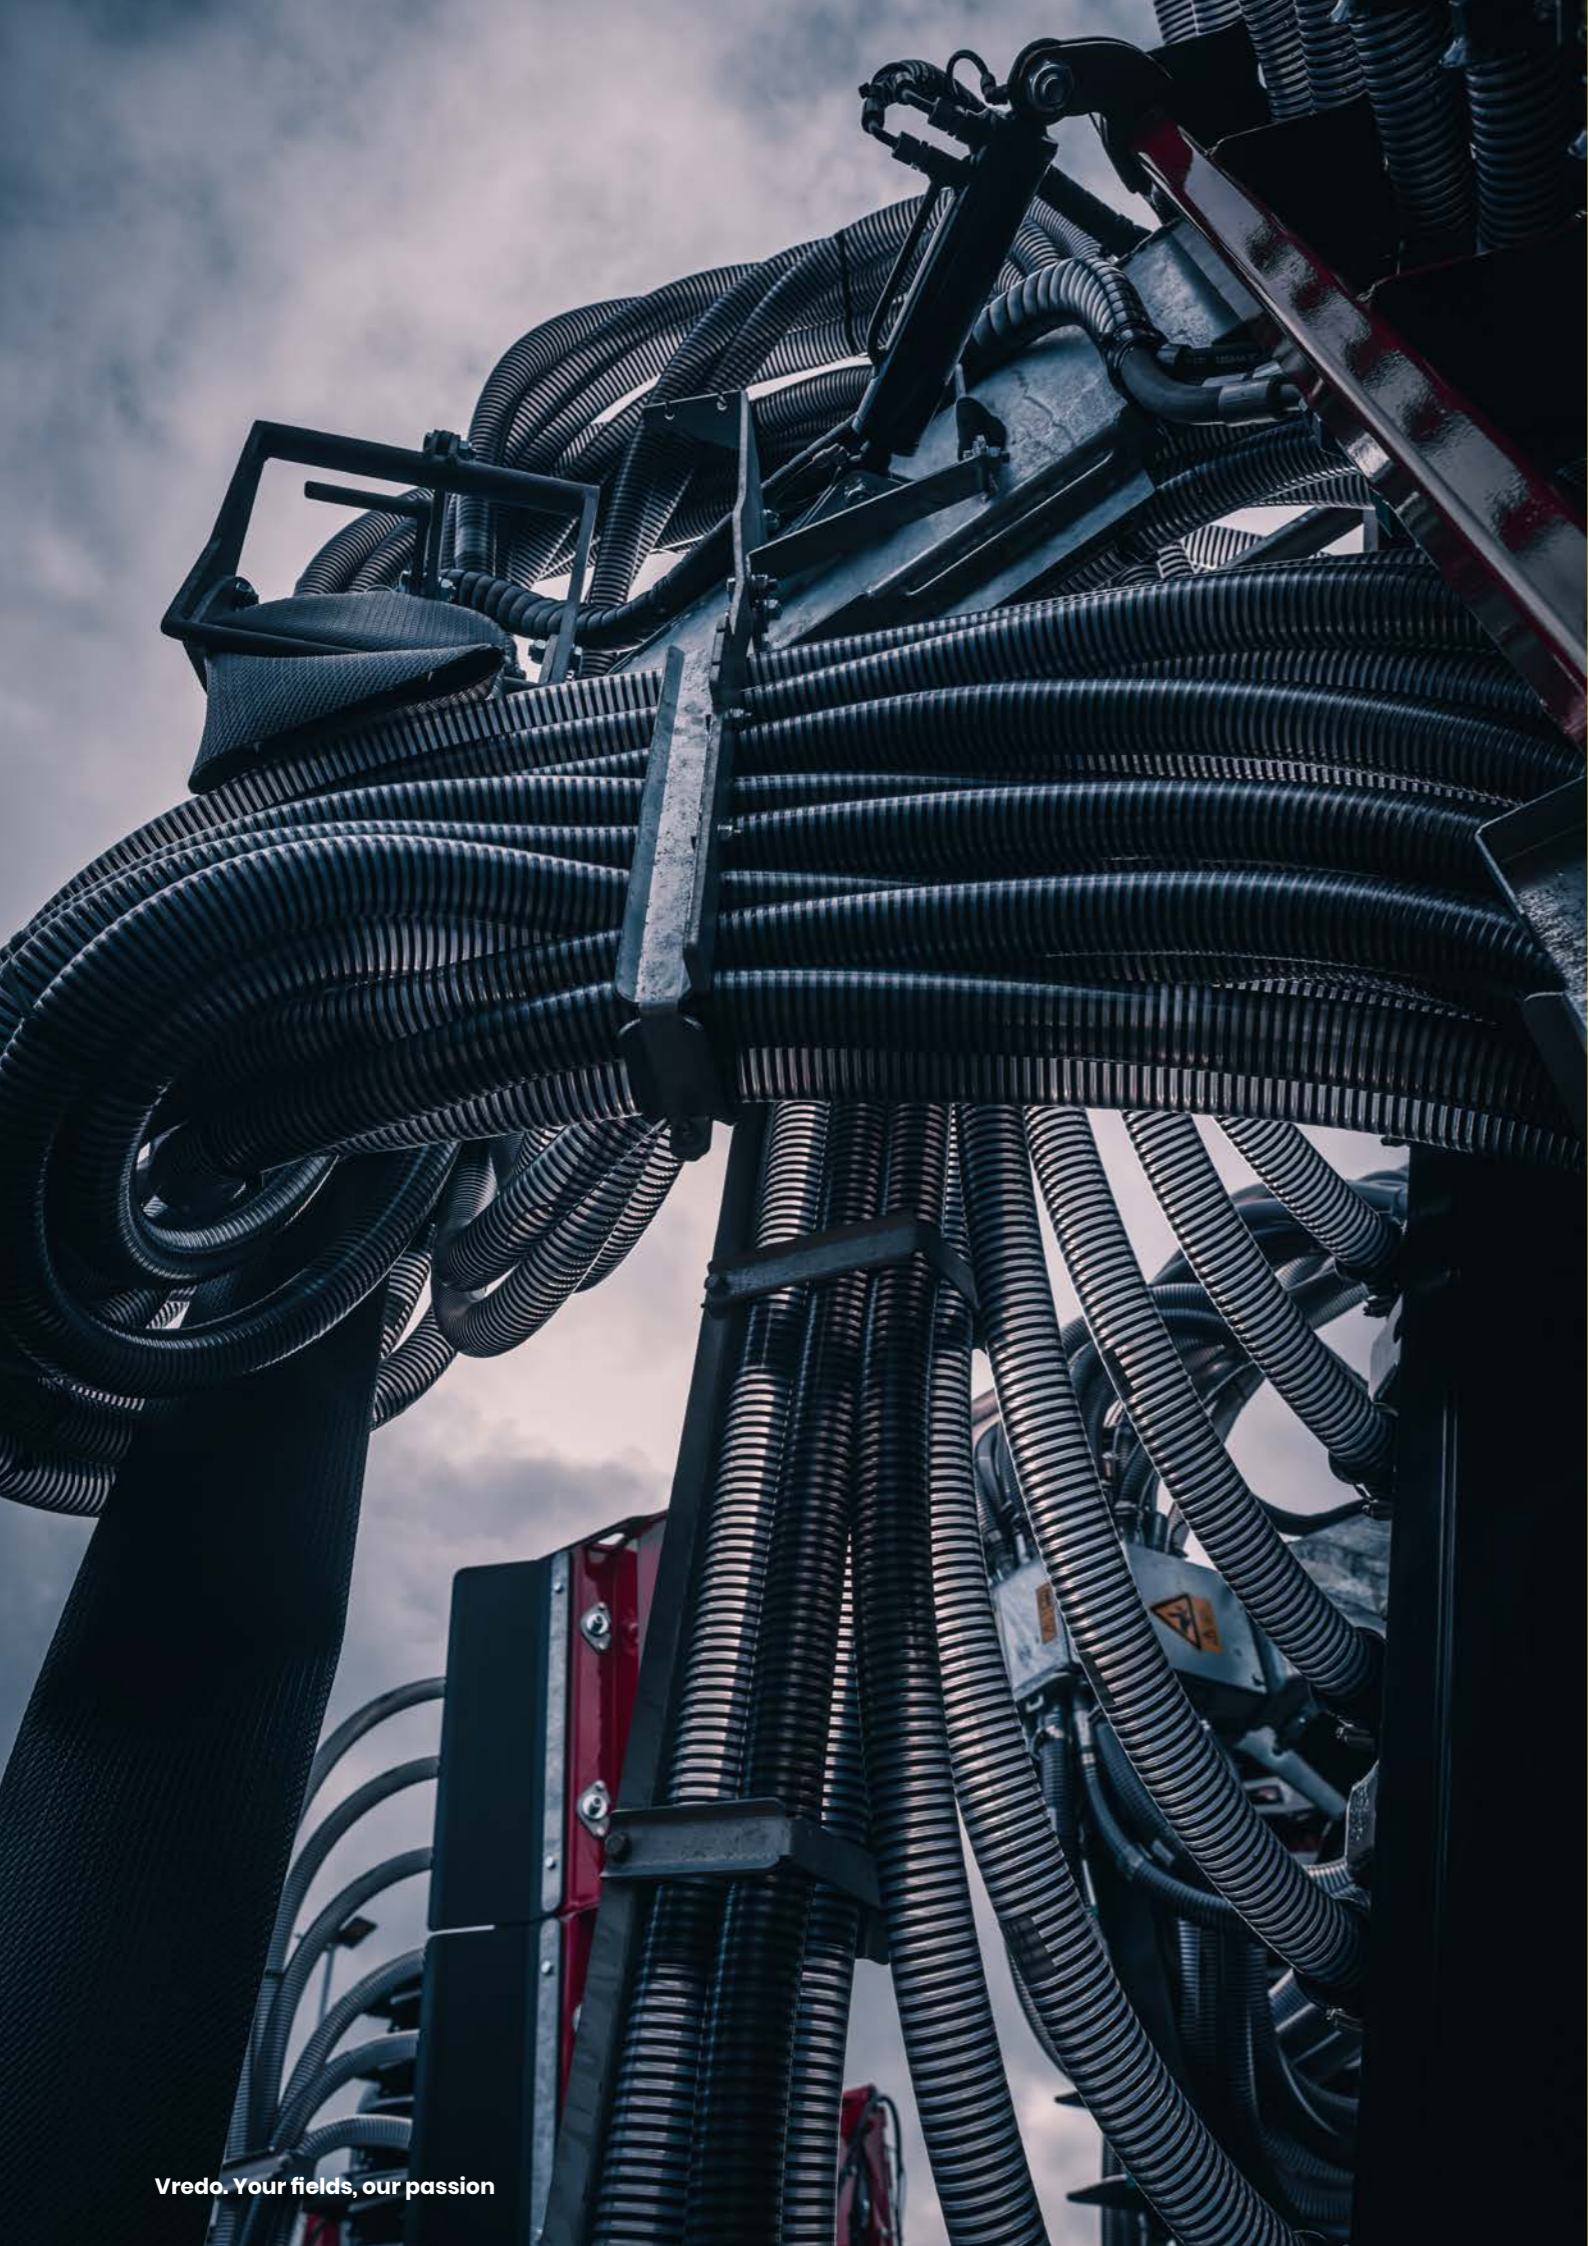

The technique
of fertilising

Your fields, our passion

Maximising crop yields

The growing worldwide demand for food for humans and animals, as well as the growing demand for good agricultural crops, calls for a responsible liquid fertiliser strategy. Vredo's fertiliser technology ensures optimum utilisation of the nutrients present in animal manure and other liquid residues (Digestate) while enabling precision fertilisation. The result? Fertile soil life with maximum healthy crop yields and minimal ammonia, phosphate and nitrate losses. **Your fields, our passion!**

Latest innovations and technological developments

Whatever fertiliser technology you are looking for: you can count on thoughtful design and comfort, with optimum weight saving, fewer wear parts and easier maintenance. Our Tracs and sod fertiliser series are fully refined and follow the latest innovations and technological developments. Precision fertilisation with premium quality!

Higher nitrogen utilisation

All our fertiliser products are developed and produced in-house and help you improve your farm efficiency. For example, fertilising your grassland with a Vredo slurry injector provides up to as much as 35% (cattle manure) and 41% (pig manure) of additional nitrogen utilisation, resulting in:

- More available nutrients
- Less fertiliser use
- No smearing
- A qualitatively better crop
- A higher yield of 1 to 2 extra cuts (in dry weather)

A company with a history

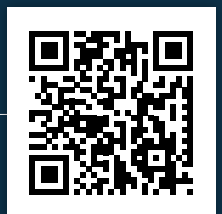

Vredo designs, produces and sells machines to the agricultural sector worldwide. From a small machine builder, we have grown into a leading international family business. Our origins lie in 1947, when Ben de Vree started a contracting company in Dodewaard as a farmer's son. Standard machines were regularly adapted for the heavy Betuwe clay soil. A self-built machine couldn't wait: in 1976, Ben produced his first self-developed overseeder.

In the late 1980s, the operating principle of this overseeder was used to develop the first slurry injector. Manure tanks were later added; followed in the 1990s by the Vredo Trac. Today, many farmers and contractors successfully use our fertiliser technology.
